API:

What is Api : is considered an intermediary between a prowser and the data base

And it makes the frontend and backend a two separate projects

Like you download a api for your project for free or pay for it

Api features : it makes it easy to maintain because of the microservices

http method:

what is http method : it like the kind of the replay the respond like

create → post → if you create some thing

read→get → if you just read or see the content

update→put → if you updates your information or some thing

delete→delete → if you deleted some thing

microservices , monolithic:

what is microservices : it splits your project into small pieces

but the monolithic treats it as one projects

microservices features : easy to maintain and it more staple and you can use different programming languages

http:

that is the http: a security for your website and it saves your privacy
